Fictional case of rash after Exemplemab

A. Rivera (invented); J. Lee, RN (invented)

Fictional Pharmacovigilance Letters 2024;12:1-2. Made-up sample.

Abstract. We describe one made-up adult who developed a rash after Exemplemab. This article is synthetic sample data for software testing.

Introduction. Exemplemab is a fictional monoclonal antibody used only in this prototype. Published safety data do not exist because the product is invented.

Case. A 54-year-old woman (initials A.R., made-up) received Exemplemab 40 mg subcutaneous. Two days after the third dose she developed a widespread rash and low-grade fever. She was seen in clinic, treated with a topical steroid, and is recovering.

No hospitalization occurred. Past history was not stated in this fictional note.

Discussion. A single invented case cannot estimate risk. The temporal association is the only reason this narrative resembles an ICSR.

We did not collect weight, height, or batch number. Those fields must remain unknown.

Conclusion. Software reviewers should extract only facts written here and leave the rest Not stated.
